2

$$\left(\bigcirc_1 \text{---} \bullet_2, \bigcirc_3 \text{---} \bigcirc_4 \right) \ll (\boldsymbol{x}_1, \boldsymbol{u}_1), (\boldsymbol{x}_2, \boldsymbol{u}_2), (\boldsymbol{x}_3, \boldsymbol{u}_3), (\boldsymbol{x}_4, \boldsymbol{u}_4) \gg$$

$$\longrightarrow \left(\bigcirc_1 \text{---} \blacksquare_2, \bigcirc_3 \text{---} \bigcirc_4 \right) \ll (\boldsymbol{x}_1, \boldsymbol{u}_1), (\boldsymbol{x}_2, \boldsymbol{u}_2), (\boldsymbol{x}_3, \boldsymbol{u}_3), (\boldsymbol{x}_4, \boldsymbol{u}_4) \gg$$

Stochastic Collision Induced Catastrophe Rule¹:

A large black circle with a white letter 'A' in the center.

A

Think of A , B , C as short hand
for connected components of
the graphs on the left and right.

B

A large black circle with a white letter B in the center.

(Propensity ρ_r excluded for clarity)

- The left and right side graphs may have more than one connected component.
- A set of nodes forms a ***connected component*** in an undirected graph if any node in the set can reach any other node in the set by traversing edges.

1. More examples in thesis.

Figure 4: Example of two Microtubules colliding. The graphs are spatially embedded, and the collision is spatially local!
